Module 1 – QA Doc / Cheat Sheet

Functional Testing Q&A

1. What is functional testing?
Functional testing checks whether the software works as per the specified requirements.

2. What are the main types of functional testing?
Common types are unit, integration, system, smoke, sanity, regression, retesting, UAT, alpha, beta, and exploratory testing.

3. What is unit testing?
Unit testing validates a single function, method, or module in isolation.

4. What is integration testing?
Integration testing checks whether multiple modules work together correctly.

5. What is system testing?
System testing validates the complete application end to end.

6. What is smoke testing?
Smoke testing is a quick check to see if the build is stable enough for further testing.

7. What is sanity testing?
Sanity testing is a focused check to verify a specific fix or change.

8. What is regression testing?
Regression testing ensures that new changes have not broken existing functionality.

9. What is retesting?
Retesting means running the same test again after a defect fix to confirm the issue is resolved.

10. What is black-box testing?
Black-box testing validates the application without looking at the internal code.

11. What is UAT?
User Acceptance Testing confirms that the software meets business needs and user expectations.

12. What is alpha testing?
Alpha testing is internal testing done before release, usually by QA or developers.

13. What is beta testing?
Beta testing is external testing done by real users in a real environment before final release.

14. What is exploratory testing?
Exploratory testing is unscripted testing where learning, test design, and execution happen together.

15. What is ad-hoc testing?
Ad-hoc testing is informal testing done without test cases or planning.

Non-Functional Testing Q&A

1. What is non-functional testing?
Non-functional testing checks how well the system works rather than what it does.

2. What are the main types of non-functional testing?
Common types are performance, load, stress, security, usability, compatibility, recovery, scalability, and localization testing.

3. What is performance testing?
Performance testing measures speed, responsiveness, and stability.

4. What is load testing?
Load testing checks system behavior under expected user load.

5. What is stress testing?
Stress testing checks how the system behaves beyond normal limits.

6. What is security testing?
Security testing identifies vulnerabilities and checks data protection.

7. What is usability testing?
Usability testing checks how easy and user-friendly the application is.

8. What is compatibility testing?
Compatibility testing verifies that the application works across browsers, devices, and operating systems.

9. What is recovery testing?
Recovery testing checks whether the system can recover after a crash or failure.

10. What is scalability testing?

Scalability testing checks whether the application can handle growth in users or data.

11. What is localization testing?
Localization testing verifies that the product works correctly for a specific region or language.

12. What is globalization testing?
Globalization testing checks whether the software is ready for multiple regions and languages.

Common Difference Questions

1. What is the difference between functional and non-functional testing?
Functional testing checks *what* the software does, while non-functional testing checks *how well* it does it.

2. What is the difference between smoke and sanity testing?
Smoke testing checks major flows in a new build, while sanity testing checks a specific fix or feature.

3. What is the difference between regression and retesting?
Retesting verifies a fixed defect; regression testing checks that old features still work after changes.

4. What is the difference between load and performance testing?
Load testing checks behavior under expected load, while performance testing covers broader speed and stability metrics.

5. What is the difference between alpha and beta testing?
Alpha testing is internal, and beta testing is done by real users before release.
